Modbus Communications Protocol

Reference Guide

Every effort has been made to ensure that the material herein is complete and accurate. However, the manufacturer is not responsible for any mistakes in printing or faulty instructions contained in this book. Notification of any errors or misprints will be received with appreciation.

For further information regarding a particular installation, operation or maintenance of equipment, contact the manufacturer or your local representative or distributor.

REVISION HISTORY

A1	Feb 2009	Initial release
A2	July 2009	Added a selectable EN 50160 transient overvoltage detection method option

Modbus is a trademark of Schneider Electric.

Table of Contents

1 GENERAL	9
2 MODBUS PROTOCOL IMPLEMENTATION	10
2.1 Transmission Modes.....	10
2.2 Address Field.....	10
2.3 Function Field.....	10
2.4 Exception Responses.....	10

1 General

This document specifies a subset of the Modbus communications protocol used to transfer data between a master computer station and the EM720. The document provides the complete information necessary to develop third-party communications software capable of communication with the EM720. Refer to the EM720 Installation Manual and EM720 Operation Manual for more information on communication connections and configuring communication parameters in your device.

2 Modbus Protocol Implementation

For detailed information on the Modbus protocol, message framing and error checking, refer to the Modbus Protocol Reference Guide. It can be downloaded from the Modbus-IDA Website at <http://www.modbus.org/>. The following paragraphs outline some issues concerning the implementation of the Modbus protocol in the EM720.

2.1 Transmission Modes

The EM720 can be set up to communicate on a serial Modbus network using either RTU, or ASCII serial transmission mode, and via the Internet using Modbus/TCP mode. Refer to the EM720 Operation Manual for information on selecting the transmission mode in your meter.

2.2 Address Field

The address field contains a user assigned address of the instrument (1-247) on a Modbus network. Broadcast mode using address 0 is not supported.

When communicating via the Internet, the address field is not checked and is returned in the response message header.

2.3 Function Field

The Modbus functions implemented in the EM720 are shown in Table 2-1. Function 04 can be used in the same context as function 03.

Table 2-1 Modbus Function Codes

Code (decimal)	Meaning in Modbus	Action
03	Read holding registers	Read multiple registers
04	Read input registers	Read multiple registers
06	Preset single register	Write single register
16	Preset multiple registers	Write multiple registers
08 ¹	Loop-back test	Communications test

¹ The EM720 supports only diagnostic code 0 - return query data.

2.4 Exception Responses

The instrument sends an exception response when an error is detected in the received message. To indicate that the response is notification of an error, the high order bit of the function code is set to 1.

Implemented exception response codes:

- 01** - Illegal function
- 02** - Illegal data address
- 03** - Illegal data value
- 04** - Device failure

When the character framing, parity, or redundancy check detects a communication error, processing of the master's request stops. The instrument will not act on or respond to the message.

2.5 Modbus Register Addresses

The EM720 Modbus registers are numbered in the range of 0 to 65535. From the Modbus applications, the EM720 Modbus registers can be accessed by simulating holding registers of the Modicon 584, 884 or 984 Programmable Controller, using a 5-digit "4XXXX" or 6-digit "4XXXXX" addressing scheme.

To map the EM720 register address to the range of the Modbus holding registers, add a value of 40001 to the EM720 register address. When a register address exceeds 9999, use a 6-digit addressing scheme by adding 400001 to the EM720 register address.

2.6 Data Formats

The EM720 uses three data formats to pass data between a master application and the instrument: 16-bit short integer, 32-bit long integer and 32-bit modulo-10000 formats. Binary values and counters are always transmitted in 32-bit registers, while analog values can be read both in 32-bit and in 16-bit scaled registers.

Analog registers 256 through 308 and 6656 through 10935 contain scaled 16-bit values.

2.6.1 16-bit Scaled Integer Format

16-bit scaled analog data is transmitted in a single 16-bit Modbus register being scaled to the range of 0 to 9999. To get a true reading, a reverse conversion should be done using the following formula:

$$Y = \frac{X \times (HI - LO)}{9999} + LO$$

where:

- Y - True reading in engineering units
- X - Raw input data in the range of 0 to 9999
- LO and HI - Data low and high scales in engineering units

Refer to Section 4 "Data Scales and Units" for applicable data scales and measurement units. The engineering scales are indicated for every scaled 16-bit register.

The default voltage scale in the device is 144V (120V+20%). It can be changed through register 242 (see Section 3.1, Device Data Scales), or via the supplemental PAS software. The recommended voltage scale is 120V+20% = 144V for using with external PT's, and 480V+25% = 600V for a direct connection to power line.

CONVERSION EXAMPLES

1. Voltage readings

a) Assume device settings (direct wiring): PT ratio = 1; Voltage scale = 600V (480V + 25%).

Voltage engineering scales (see Section 4):

$$HI_ENG = V_{max} = 600.0 \times PT \text{ ratio} = 600.0 \times 1 = 600.0V$$

$$LO_ENG = 0V$$

If the raw data reading is 2000 then the voltage reading in engineering units will be as follows:

$$\text{Volts reading} = 2000 \times (600.0 - 0) / (9999 - 0) + 0 = 120.0V$$

b) Assume device settings (wiring via PT): PT ratio = 14,400V : 120V = 120; Voltage scale = 144V.

Voltage engineering scales (see Section 4):

$$HI_ENG = V_{max} = 144.0 \times PT \text{ ratio} = 144 \times 120 = 17,280V$$

$$LO_ENG = 0V$$

If the raw data reading is 8314 then the voltage reading in engineering units will be as follows:

$$\text{Volts reading} = 8314 \times (17,280 - 0) / 9999 + 0 = 14,368V$$

2. Current readings

Assume device settings: CT primary current = 200A.

Current engineering scales (see Section 4):

$$\text{HI_ENG} = I_{\text{max}} = \text{CT primary current} \times 2 = 200.00 \times 2 = 400.00\text{A}$$

$$\text{LO_ENG} = 0\text{A}$$

If the raw data reading is 250 then the current reading in engineering units will be as follows:

$$\text{Amps reading} = 250 \times (400.00 - 0)/(9999 - 0) + 0 = 10.00\text{A}$$

3. Power readings

a) Assume device settings (direct wiring): Wiring 4LL3; PT = 1; CT primary current = 200A; Voltage scale = 600V.

Active power engineering scales (see Section 4):

$$\text{HI_ENG} = P_{\text{max}} = V_{\text{max}} \times I_{\text{max}} \times 2 = (600.0 \times 1) \times (200.00 \times 2) \times 2 = 662,400\text{W} = 480.000\text{ kW}$$

$$\text{LO_ENG} = -P_{\text{max}} = -480.000\text{kW}$$

If the raw data reading is 5500 then the power reading in engineering units will be as follows:

$$\text{Watts reading} = 5500 \times (480.000 - (-480.000))/(9999 - 0) + (-480.000) = 48.053\text{ kW}$$

If the raw data reading is 500 then the power reading in engineering units will be as follows:

$$\text{Watts reading} = 500 \times (480.000 - (-480.000))/(9999 - 0) + (-480.000) = -431.995\text{kW}$$

b) Assume device settings (wiring via PT): Wiring 4LN3; PT = 120; CT primary current = 200A.

Active power engineering scales (see Section 4):

$$\text{HI_ENG} = P_{\text{max}} = V_{\text{max}} \times I_{\text{max}} \times 3 = (600 \times 120) \times (200.00 \times 2) \times 3/1000 = 86,400\text{ kW}$$

$$\text{LO_ENG} = -P_{\text{max}} = -86,400\text{ kW}$$

If the raw data reading is 5500 then the power reading in engineering units will be as follows:

$$\text{Watts reading} = 5500 \times (86,400 - (-86,400))/(9999 - 0) + (-86,400) = 8,650\text{ kW}$$

If the raw data reading is 500 then the power reading in engineering units will be as follows:

$$\text{Watts reading} = 500 \times (86,400 - (-86,400))/(9999 - 0) + (-86,400) = -77,759\text{ kW}$$

4. Power Factor readings

Power factor engineering scales (see Section 3.3):

$$\text{HI_ENG} = 1.000.$$

$$\text{LO_ENG} = -1.000.$$

If the raw data reading is 8900 then the power factor in engineering units will be as follows:

$$\text{Power factor reading} = 8900 \times (1.000 - (-1.000))/(9999 - 0) + (-1.000) = 0.78$$

2.6.2 32-bit Long Integer Format

32-bit long integer data is transmitted in two adjacent 16-bit Modbus registers as unsigned (UINT32) or signed (INT32) whole numbers. The first register contains the low-order word (lower 16 bits) and the second register contains the high order word (higher 16 bits). The low-order word always starts at an even Modbus address.

The value range for unsigned data is 0 to 4,294,967,295; for signed data the range is -2,147,483,648 to 2,147,483,647.

If your Modbus driver does not support a 32-bit long integer format, you can read the two 16-bit registers separately, and then convert them into a 32-bit value as follows (using C notation):

$$\text{32-bit value} = (\text{signed short}) \text{high_order_register} \times 65536\text{L} + (\text{unsigned short}) \text{low_order_register}$$

EXAMPLES

1. Unsigned 32-bit Values

If you read unsigned Voltage V1 of 69,000V from registers 13952-13953, then the register readings will be as follows:

$$(13952) = 3464$$

$$(13953) = 1$$

The 32-bit value is $(1 \times 65536 + 3464) = 69000V$.

2. Signed 32-bit Values

If you read signed kW of -789kW from registers 14336-14337, then the register readings will be:

$$(14336) = 64747 \text{ (unsigned)}$$

$$(14337) = 65535 \text{ (unsigned) or } -1 \text{ (signed value)}.$$

To take the high order register as a signed value, compare it with 32767. If the value is less or equal to 32767, use it as is. If it is greater than 32767, then this is a negative number in a two's complement code (like in our example) - just subtract it from 65536 to get the original negative value.

The 32-bit reading is $(-1 \times 65536 + 64747) = -789kW$.

Fractional 32-bit data is transmitted using a decimal pre-multiplier to pass fractional numbers in an integer format. Fractional numbers are pre-multiplied by 10 to the power N, where N is the number of digits in the fractional part. For example, the frequency reading of 50.01 Hz is transmitted as 5001, having been pre-multiplied by 100.

Whenever a data register contains a fractional number, the register measurement unit is given with a multiplier $\times 0.1$, $\times 0.01$ or $\times 0.001$, showing the weight of the least significant decimal digit. To get an actual fractional number with specified precision, multiply the register value by the given multiplier. To write a fractional number into the register, divide the number by the given multiplier.

2.6.3 32-bit Modulo-10000 Format

Energy counters 287-294 and 301-302 are read in two contiguous 16-bit registers in a modulo-10000 format. The first (low order) register contains the value mod 10000, and the second (high order) register contains the value/10000. To get the true energy reading, the high order register value should be multiplied by 10,000 and added to the low order register.

2.7 User Assignable Registers

The EM720 has 120 user assignable registers in the address range of 0 to 119, any of which you can map to any register address accessible in the instrument. Registers that reside in different locations may be accessed by a single request by re-mapping them to adjacent addresses in the user assignable registers area.

The actual addresses of the assignable registers, which are accessed via addresses 0 through 119, are specified in the register map (registers 120 through 239), where register 120 contains the actual address of the register accessed via register 0, register 121 contains the actual address of the register accessed via register 1, and so on. The assignable registers and the map registers themselves may not be re-mapped.

To build your own register map, write to map registers 120 to 239 the actual addresses you want to read from or write to via the assignable area (registers 0 to 119). 32-bit long registers should always be aligned at even addresses. For example, if you want to read registers 7136 (1-second V1 voltage, scaled short integer) and 14720-14721 (kWh Import, long integer) via registers 0-2, do the following:

- write 14720 to register 120
- write 14721 to register 121
- write 7136 to register 122

Reading from registers 0-2 will return the kWh reading in registers 0 (low 16 bits) and 1 (high 16 bits), and the voltage reading in register 2.

2.8 Password Protection

The EM720 has a password protection for setups, cumulative registers and log files from being changed or cleared via communications. Refer to the EM720 Operation Manual for details.

A user password must be written into the 32-bit device authorization register (44378-44379) before another write request is issued. If the correct password is not supplied, the meter will respond to all write requests directed to the meter setup and reset registers with the exception code 01 (illegal operation). It is recommended to clear the authorization register after you have completed your changes in order to activate password protection.

2.9 Data Recording and File Transfers

2.9.1 Log File Organization

Historical files are stored to the non-volatile flash memory. Memory is allocated for each file statically when you set up your files and will not change unless you re-organize the files. The EM720 automatically performs de-fragmentation of the memory each time you re-organize your files. This prevents possible leakage of memory caused by fragmentation.

Data records in a file are arranged in the order of their recording. Each record has a unique 16-bit sequence number that is incremented modulo 65536 with each new record. The sequence number can be used to point to a particular record in the file, or to check the sequence of records when uploading files from the device.

Each file has a write position pointer that indicates the place where the next record will be recorded, and a read position pointer that indicates the place from where the current record will be read. Both pointers show sequence numbers of the records they point to rather than record offsets in the file.

After acknowledging a record you have read, the read pointer automatically advances to the next record in the file. When the read pointer gets to the record to which the file write pointer points, the end-of-file (EOF) flag is set. It is automatically cleared when a new record is added to the file, or when you explicitly move the read pointer to any record within a file.

If a file has a wrap-around attribute (circular file), the most recent records can overwrite the oldest records. When this happens at the current read position, the read pointer automatically advances forward in order to point to the oldest record in the file.

The EM720 keeps a separate read pointer for each communication port so that access to the same file through a different port will not affect current active sessions for other ports.

Multi-section Files

Log files can have one or more (up to 20) sections for multi-channel recording. An ordinal file consists of a single section. Some files, such as daily profile log files and waveform log files, are arranged as multi-section files.

A multi-section file is subdivided into multiple sections of the same structure, one section per recording channel. The number of sections in each file is defined at the time you set up your files and may not change unless you re-organize the file. Each section within a multi-section file can be addressed by a section number, or by a section channel ID.

A multi-section file has a single write position pointer for all sections and stores data in all sections simultaneously. This means that records with the same sequence number in all sections are associated with the same event. A multi-section file has also a single read position pointer for all sections.

Data Log Files

Conventional data log files can store up to 16 measured parameters per a record. Any data measured by the device can be stored in the log file. The number of parameters

that each record will hold and the list of parameters you want to be recorded in the file can be selected through the Data log setup registers for a particular file.

Recording data to data log files can be triggered through the setpoints, either on a time basis, or upon any event detected by the setpoints.

Billing/TOU Profile Data Log Files

Data log files #15 and #16 are factory configured for monthly and daily profile logs of the energy usage and maximum demand registers. A profile log file is organized as a multi-section file that has a separate section for each energy and maximum demand register. See Sections 3.13-3.14 for more information on the file record structure. A file record stores the summary data (total of all tariffs) and all tariff data for each configured Summary/TOU register.

The number of sections is taken automatically from your Summary/TOU Registers setup. Since each Summary/TOU energy register has a shadow maximum demand register, the number of sections in the file can be twice the number of the allocated Summary/TOU registers.

Power Quality Statistics Log Files

Data log files #9 and #10 are configured to store the power quality statistics data on a daily or weekly basis. They are organized as multi-section files. See Sections 3.11-3.12 for more information on the file record structure. You can review the list of parameters recorded to the files through the file info request/response blocks using info requests with variation 2 (see Section 3.10).

Waveform Log Files

Waveform log files are organized as multi-section files that store data for each recording channel in a separate section. A waveform log file can record up to six AC channels simultaneously: three voltage and three current waveforms. The number of sections in a file, or channels that a file can store, is defined when you set up the file. The channels that a file will record are selected in the waveform log setup. All selected channels are recorded in successive file sections.

A waveform file has a single read pointer for all sections, so that data from all channels of a single record can be read together without repositioning the file pointer. When you point to a particular file record, data from all sections related to the same event are all available for a read. Moreover, the EM720 takes all channel data for the currently accessed record to a separate buffer, so that even when the record is overwritten at the time of reading, you are still prevented from receiving partially updated data.

A single waveform record for a channel can contain up to 512 points of the sampled input signal. Refer to the line frequency field in the channel header record to correctly set up the time scale for the waveforms.

If a waveform log is configured to record more samples per event than a single record can hold, the waveform recorder will store as many records per event as required to record the entire event. All waveform records related to the event are merged in a series and have the same series number, so that they can be plotted together. Each record within a series has a unique serial number that allows tracking the sequence of records in a series. A single waveform series can hold up to 81,920 points (2,560 cycles at a rate of 32 samples per cycle) of a sampled AC signal.

2.9.2 File Transfers

File transfer protocol provides both data transfer and information services. File transfer is performed through two blocks of registers: a 32-word master request block and a 288-word read-only file response block. After a master application has written the request into the file request block, the requested data is available for a read through the file response block registers. File transfer functions allow changing the file or section position in order to point to the desired record.

The information services use separate 8-word file info request and 200-word file info response blocks. The extended file information is available including current file pointers' positions, file contents, the number of records in the file, allocated file size, time of the last file update, and more.

Common File Transfer

Log files can be read either in a sequence record-by-record, or in a random order. Each Read-File request fills the file response block with the data of the record pointed to by the file (or section) read pointer. If you want to begin reading a file from a particular record, which sequence number is known, you can change the pointer position by issuing the Set-File-Position request with the desired sequence number. If you want to read a file from the beginning, send the Reset-File-Position request that moves the pointer to the oldest file record. If you do not change the file position, then you will continue reading the file from the record following the one you have read the last time you accessed the file.

You need not explicitly move the file position to the following record if you want to continue reading a file in sequence after you have uploaded the current record. Instead, issue an acknowledgment request that automatically advances the file pointer to the next record, and then read the record data through the file response block.

The file response block can contain more than one record. The number of records available in the block and the file record size in words are always reported in the block heading. There are no special rules on how to read records from the file transfer block. You can read a single record or all records together, or begin reading from the last record and end with the first record. However, you should remember: 1) after an acknowledgment, the file position moves to the record following the last one you have accessed in the file transfer block; and 2) data in the file transfer block does not change until you either issue an acknowledgment, or explicitly change the file position by the Set-File-Position or Reset-File-Position requests.

The file transfer is completed after you have read the last record of the file. Before storing a file record to your database, always check bit 9 in the record status word, which contains the end-of-file (EOF) flag. This bit set to 1 indicates that the file read pointer does not point to any record within the file, and you should not store any record that has this bit set. The EOF flag is set only after you have acknowledged the last record of the file, so that testing for end-of-file requires one extra read. If you wish to stop the transfer just after storing the last file record, acknowledge the record and check bit 0 in the record status word. Bit 0 is set to 1 only once when you read the last record of the file.

The following gives a summary of steps you should do to read an ordinal log file:

1. If you want to begin reading a file from a particular record or from the first record, use either the Set-File-Position request with the desired record sequence number, or the Reset-File-Position request. Preset a section number and channel ID to zero.
2. Write the Read-File request with a section number and channel ID set to zero.
3. Read the record data from the file response block.
4. Write an acknowledgment for the file. You need not fill all the request fields: only the file function is required. The file pointer will be moved to the next file record.
5. Repeat steps 3-4 until all the file records are read.

Reading Multi-section Data Log Files

In a multi-section data log file, all user requests including an acknowledgment, the Read-File, Set-File-Position and Reset-File-Position requests, relate to a particular file section rather than to the file itself. The only request that affects the entire file is the Erase-File that clears all the file sections together.

A file section can be requested either by a section number, or by a section channel ID. If you use a channel ID, preset the section number field to 0xFFFF. If a section number is specified, the channel ID field will not be checked. The device returns both fields in the response block heading, so you can always identify what channel data is being read from the present file section. If you want to know which channels are recorded to the file sections, check the file channel mask in the file info block. This is a bitmap that contains one in a bit position if a channel with an ID equal to the bit number is recorded to the file, and contains zero if it is not.

The following gives a summary of steps for reading a multi-section data log file:

1. If you wish to begin reading a file section from a particular record or from the first record, use either the Set-File-Position request with the desired record sequence number, or the Reset-File-Position request. Specify either a section number, or the channel ID for the section from where you want to read data. If you use a channel ID, preset the section number field to 0xFFFF.
2. Write the Read-File request with the section number and channel ID as shown in the previous step.
3. Read the record data from the file response block.
4. Write an acknowledgment for the file. The file section pointer will be moved to the next record.
5. Repeat steps 3-4 until all the section records are read.

Reading Multi-section Waveform Files

Waveform files can be read as conventional multi-section files in the order described above. Another way is to take advantage of the fact that waveform files have a single read pointer for all file sections, so you can read records of all the channels related to the same event at once without repositioning the file pointer. The following gives a summary of steps for reading waveform files:

1. If you want to begin reading a file from a particular record or from the first record, use either the Set-File-Position request with the desired record sequence number, or the Reset-File-Position request. Preset the section field to zero.
2. Write the Read-File request. Address your request to the first file section (its number is always zero), or to the first file channel (if you know channel's ID). If you use a channel ID, preset the section number field to 0xFFFF.
3. Read the channel's data from the file response block. Store the received record's sequence number.
4. Write the Read-File request for the next file section or channel using the stored record sequence number. The file response block will be refilled with the data for the requested channel that is related to the record with the same sequence number.
5. Repeat steps 3, 4 until all the channel records with the current sequence number are read.
6. Write an acknowledgment. The file pointer will be moved to the next record.

Repeat steps 2-6 until all the file records are read.

Reading Real-time Waveforms

Real-time waveforms are accessed through the same transfer blocks just like the waveform log files by addressing file 128. Writing the Read-File request for file 128 provides a simultaneous capture of 6 real-time waveform records – three voltage and three current waveforms – into a communication buffer that can be read through the common file response block. The following gives a summary of steps for reading real-time waveforms:

1. Write the Read-File request for file 128. Address your request to the first file section (its number is always zero), or to the first file channel (if you know channel's ID). If you use a channel ID, preset the section number field to 0xFFFF.
2. Read the channel's data from the file response block.
3. Write the Read-File request for the next file section or channel. The file response block will be refilled with the data for the requested channel.
4. Repeat steps 3, 4 until all the channel records are read.
5. Write an acknowledgment to release the buffer.

3 Modbus Register Map

3.1 Modbus Setup Registers

Address	Point ID	Description	Options/Range	Units	Type	R/W	Notes
Modbus Assignable Registers							
0-119							
+0		Register 0 contents	0-65535		UINT16	R/W	
+1		Register 1 contents	0-65535		UINT16	R/W	
		...					
+119		Register 119 contents	0-65535		UINT16	R/W	
Assignable Registers Map							
120-239							
+0		Mapped register 0 address	0-65535		UINT16	R/W	
+1		Mapped register 1 address	0-65535		UINT16	R/W	
+119		Mapped register 119 address	0-65535		UINT16	R/W	
Modbus Conversion Scales							
240		Low raw scale	0		UINT16	R

NOTES:

- ¹ When the 4LN3 or 3LN3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line voltages.
- ² All analog registers except of harmonics are 1-second average values. For volts, amps and power scales and units, refer to Section 4 "Data Scales and Units". For analog data scaling formulas and examples, see Section 2.6.1, "16-bit Scaled Integer Format".
- ³ On a 3-s interval.
- ⁴ Positive readings of kvarh net.
- ⁵ Negative readings of kvarh net.
- ⁶ If you use these energy registers instead of 32-bit registers, limit the energy roll value to 8 digits (see Device Options Setup) to avoid early overflow.

NOTES:

- ¹ When the 4LN3, 4LL3, 3LN3 or 3LL3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line.
- ² When the 4LN3 or 3LN3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line voltages.
- ³ For volts, amps, power and frequency scales and units refer to Section 4 "Data Scales and Units". For analog data scaling formulas and examples, see Section 2.6.1, "16-bit Scaled Integer Format".
- ⁴ Harmonic angles are referenced to the fundamental voltage harmonic H01 on phase L1.
- ⁵ On a 0.2-s interval.
- ⁶ On a 3-s interval.

3.4 32-bit Analog Registers, Binary Registers and Counters

NOTES:

- ¹ When the 4LN3, 4LL3, 3LN3 or 3LL3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line.
- ² When the 4LN3 or 3LN3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line voltages.
- ³ For volts, amps, power and frequency scales and units, refer to Section 4 "Data Scales and Units".
- ⁴ Harmonic angles are referenced to the fundamental voltage harmonic H01 on phase L1.
- ⁵ On a 0.2-s interval.
- ⁶ On a 3-s interval.
- ⁷ a) In event log files represent line-to-neutral voltages;
b) In data log files represent line-to-neutral voltages in 4LN3, 4LL3, 3LN3 and 3LL3 wiring modes, and line-to-line voltages in other wiring modes.

3.5 Minimum/Maximum Log Registers

NOTES:

- ¹ When the 4LN3, 4LL3, 3LN3 or 3LL3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line.
- ² When the 4LN3 or 3LN3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line voltages.
- ³ For volts, amps, power and frequency scales and units, refer to Section 4 "Data Scales and Units".
- ⁴ On a 0.2-s interval.

3.7 Device Control and Status Registers

Address	Point ID	Description	Options/Range	Units	Type	R/W	Notes
User Event Flags Registers (bit map)							
44032-44033		Event flags set register (0 = no effect, 1 = set)	0x00000000 - 0x000000FF		UINT32	W	
44034-44035		Event flags clear register (0=clear, 1 = no effect)	0x00000000 - 0x000000FF		UINT32	W	
44036-44037		Event flags status (0 = cleared, 1 = set)	0x00000000 - 0x000000FF		UINT32	R	
Remote Relay Control Registers (bit map)							
44038-44045		Not used			UINT16		
44046-44047		Force relay operate register (0 = no effect, 1 = operate)	0x00000000 - 0x00000FFF		UINT32	W	
44050-44051		Force relay release register (0 = no effect, 1 = release)	0x00000000 - 0x00000FFF		UINT32	W	
44054-44055		Locally latched relays status (0 = unlatched, 1 = locally latched)	0x00000000 - 0x00000FFF		UINT32	R	
44058-44059		Remote latched relays status (0 = unlatched, 1 = remote latched)	0x00000000 - 0x00000FFF		UINT32	R	
44062-44063		Remote relay control disabled status (0 = remote control enabled, 1 = remote control disabled)	0x00000000 - 0x00000FFF		UINT32	R	Remote relay control is disabled if the internal pulse source is linked to the relay
44066-44067		Relay status (0 = open, 1 = closed)	0x00000000 - 0x00000FFF		UINT32	R	
44070-44071		Latch relays (0 = not latched mode, 1 = latched mode)	0x00000000 - 0x00000FFF		UINT32	R	
44074-44075		Pulse relays (0 = not pulse mode, 1 = pulse mode)	0x00000000 - 0x00000FFF		UINT32	R	
44078-44079		KYZ relays (0 = not KYZ mode, 1 = KYZ mode)	0x00000000 - 0x00000FFF		UINT32	R	
44082-44083		Relay polarity (0 = normal mode, 1 = inverting mode)	0x00000000 - 0x00000FFF		UINT32	R	
44086-44101		Reserved			UINT32		
Reset/Clear Registers							
44102		Reserved			UINT16		
44103		Clear maximum demands	0 = clear all maximum demands 1 = clear power demands 2 = clear volt and ampere demands 3 = clear volt demands 4 = clear ampere demands 5 = clear harmonic demands		UINT16	W	
44104		Reserved			UINT16		
44105		Clear Billing/TOU maximum demands	0		UINT16	W	
44106		Clear counters	0 = clear all counters, 1-8 = clear counter #1-#8		UINT16	W	
44107		Clear Min/Max log	0		UINT16	W	
44108		Clear accumulators/event counters	0 = clear EN50160 counters		UINT16	W	

Address	Point ID	Description	Options/Range	Units	Type	R/W	Notes
			1 = clear device diagnostics 2 = clear device operation time 3 = clear lithium battery operation time 4 = clear auxiliary NiMH battery pack operation time 5 = clear power fault counters				
44109-44133		Reserved			UINT16		
Device Mode Control Registers							
44134-44135		Reserved			UINT16		
44136		PQ recorder	0 = disabled, 1 = enabled		UINT16	R/W	
44137		Fault recorder	0 = disabled, 1 = enabled		UINT16		
44138-44165		Reserved			UINT16		
Operation/Event Counters							
44198-44199		Device's start of operation date	F1		UINT32	R	
44200-44201		Device operation time		sec	UINT32	R	
44202-44203		Lithium battery's start of operation date	F1		UINT32	R	
44204-44205		Lithium battery operation time		sec	UINT32	R	
44206-44207		Auxiliary NiMH battery's start of operation date	F1		UINT32	R	
44208-44209		Auxiliary NiMH battery pack operation time		sec	UINT32	R	
44210-44211		Device out-of-service time		sec	UINT32	R	
44212-44213		Device power failure counter	0-65535		UINT32	R	
44214-44215		Power interruption counter	0-65535		UINT32	R	
44216-44261		Reserved			UINT32	R	
Memory Status Registers							
44262-44263		Memory size, bytes			UINT32	R	
44264-44265		Free memory, bytes			UINT32	R	
44266-44277		Reserved			UINT32	R	
Log Notification Registers (bit map)							
44278-44279		Files 0-31 (0 = no new logs, 1 = new record logged)	0x00000000 - 0xFFFFFFFF		UINT32	R	
44280-44293		Reserved	0		UINT32	R	
Setpoint Status Registers (bit map)							
44294-44295		Setpoints 1-16 status (0 = released, 1 = operated)	0x00000000 - 0x0000FFFF		UINT32	R	
44296-44309		Reserved			UINT32	R	
Setpoint Alarm Latch Registers (bit map)							
44310-44311		Setpoints 1-16 alarm status. When read: 0 = no setpoint operations logged, 1 = setpoint has been operated at least once since the last alarm bit reset. When written: 0 = clear setpoint alarm bit, 1 = no effect.	0x00000000 - 0x0000FFFF		UINT32	R/W	
44312-44325		Reserved					
Device Diagnostics Register (bit map)							
44326-44327		Device self-diagnostics flags. When read: 0 = no faults logged, 1 = a fault bit has	F23		UINT32	R/W	

Address	Point ID	Description	Options/Range	Units	Type	R/W	Notes
		been set at least once since the last reset. When written: 0 = clear a fault bit, 1 = no effect.					
44328-44341		Reserved					
Current Port Number							
44342		Active port number	0-2 = serial port COM1-COM3		UINT16	R	
44343-44345		Reserved					
Current Network Settings							
44346-44377							
+0,1		Ethernet network IP address			UINT32	R	Network byte order
+2,3		Ethernet network subnet mask			UINT32	R	Network byte order
+4,5		Ethernet network default gateway			UINT32	R	Network byte order
+6,7		Not used			UINT32	R	
+8,9		Not used			UINT32	R	
+10,11		GPRS network IP Address			UINT32	R	Network byte order
+12,13		GPRS network subnet mask			UINT32	R	Network byte order
+14,15		GPRS network default gateway			UINT32	R	Network byte order
44362-44377		Reserved					
Device Authorization Registers							
44378-44379		Write: 8-digit password. Read: 0 = access permitted, -1 = authorization required.	0 - 99999999 (write) 0/-1 (read)		INT32	R/W	
Factory Diagnostic Registers							
45952-46079		Factory diagnostic registers			UINT32	R	

3.8 Device Setup Registers

Address	Point ID	Description	Options/Range	Units	Type	R/W	Notes
Device Identification							
46080-46111							
+0,1		Device serial number	0-999999		UINT32	R	
+2,3		Device model ID	72000		UINT32	R	
+4-11		Device model name	"EM720"		CHAR16	R	Null-terminated string
+12-13		Device options (bitmap)	F27		UINT32	R	
+14-15		Device production date and time	F1		UINT32	R	
+16-19		Not used			UINT16	R	
+20		Device firmware version number	2600-2699		UINT16	R	Two higher decimal digits = major version number, two lower decimal digits = minor version number
+21		Device firmware build number	1-99		UINT16	R	
+22		Transient coprocessor firmware version number	2700-2799		UINT16	R	
+23		Transient coprocessor firmware build number	1-99		UINT16	R	
+24		Boot loader version number			UINT16	R	
+25		Boot loader build number	1-99		UINT16	R	
+26-31		Not used			UINT16	R	
Factory Device Settings							
46112-46178							
+0		V1-V4 input range	480, 120 (option U)	V	UINT16	R	
+1		V1-V4 input overload	125	%	UINT16	R	
+2,3		Not used			UINT16	R	
+4		I1-I4 input range	1, 5	A	UINT16	R	
+5		I1-I4 input overload	200	%	UINT16	R	
+6-13		Not used			UINT16		
+14-63		Reserved			UINT16		
+64		Ethernet MAC address 0-1	0x0500		UINT16	R	
+65		Ethernet MAC address 2-3	0x00F0		UINT16	R	
+66		Ethernet MAC address 4-5	0x0000-0xFFFF		UINT16	R	
Basic Setup							
46208-46271							
+0		Wiring mode	F26		UINT16	R/W	
+1		PT ratio (primary to secondary ratio)	10-65000	×0.1	UINT16	R/W	
+2		PT secondary (line-to-line) voltage	50-480	V	UINT16	R/W	
+3-4		Reserved			UINT16	R	Read as 65535
+5		CT primary current	1-20000	A	UINT16	R/W	
+6		Reserved			UINT16	R	Read as 65535
+7		I4 CT primary current	1-20000	A	UINT16	R/W	
+8-16		Reserved			UINT16	R	Read as 65535
+17		Nominal line frequency	50, 60	Hz	UINT16	R/W	
+18-23		Reserved			UINT16	R	Read as 65535

Address	Point ID	Description	Options/Range	Units	Type	R/W	Notes
+24		I maximum demand load current	0-20000	A	UINT16	R/W	
+25		I4 maximum demand load current	0-20000	A	UINT16	R/W	
+26-31		Reserved			UINT16	R	Read as 65535
Demands Setup							
46240-46255							
+0		Power demand period (block interval)	1, 2, 3, 5, 10, 15, 30, 60	min	UINT16	R/W	
+1		Number of demand periods in a sliding window	1-15		UINT16	R/W	
+2		Demand synchronization source input	0 = device clock, 1-8 = DI1-DI8		UINT16	R/W	A DI input is considered a pulse or KYZ input. The pulse edge restarts the power demand accumulation interval.
+3-7		Reserved			UINT16	R/W	Read as 65535
+8		Volt demand period	0-9000	sec	UINT16	R/W	
+9		Ampere demand period	0-9000	sec	UINT16	R/W	
+10		Harmonic demand period	0-9000	sec	UINT16	R/W	
+11-15		Reserved			UINT16	R/W	Read as 65535
Device Options Setup							
46256-46268							
+0		Power calculation mode	0 = using reactive power: $S = f(P,Q)$, 1 = using non-active power: $Q = f(S,P)$		UINT16	R/W	
+1		Energy roll value	2 = 100,000.0 kWh 3 = 1,000,000.0 kWh 4 = 10,000,000.0 kWh 5 = 100,000,000.0 kWh (default)		UINT16	R/W	
+2		Reserved			UINT16	R/W	Read as 65535
+3		End of billing (TOU/Billing maximum demand reset) mode, bitmap	Bit 0 = 1 – automatic/monthly mode allowed Bit 1 = 1 - COM mode allowed Bit 2 = 1 - manual mode allowed		UINT16	R/W	
+4-6		Reserved			UINT16	R/W	Read as 65535
+7		Energy LED test mode	0 = disabled, 1 = enabled		UINT16	R/W	
+8		Energy LED pulse rate, Wh/impulse, varh/impulse (in secondary units)	1 - 40	×0.01Wh	UINT16	R/W	
+9-12		Reserved			UINT16	R/W	Read as 65535
Local Settings							
46400-46415							
+0		Local time offset, min	0- +/-720	min	INT16	R/W	
+1		Daylight savings time (DST) option	0=DST disabled (standard time only), 1=DST enabled (fixed switching dates), 2= scheduled DST period (calendar		UINT16	R/W	

Address	Point ID	Description	Options/Range	Units	Type	R/W	Notes
			defined switching dates)				
+2		DST start month	1-12		UINT16	R/W	
+3		DST start week of the month	1=1st, 2=2nd, 3=3rd, 4=4th week, 5=the last week of the month		UINT16	R/W	
+4		DST start weekday	1-7 (1=Sun, 7=Sat)		UINT16	R/W	
+5		DST end month	1-12		UINT16	R/W	
+6		DST end week of the month	1=1st, 2=2nd, 3=3rd, 4=4th week, 5=the last week of the month		UINT16	R/W	
+7		DST end weekday	1-7 (1=Sun, 7=Sat)		UINT16	R/W	
+8		Clock synchronization source	0=IRIG-B, 1-8 = DI1-DI8, 0xfffe = SNTP, 0xffff = none		UINT16	R/W	A DI input is considered a pulse or KYZ input. The pulse edge adjusts the clock at the nearest whole minute.
+9		Country code	ITU country calling code		UINT16	R/W	
+10		DST start hour	1-6		UINT16	R/W	
+11		DST end hour	1-6		UINT16	R/W	
+12-15		Reserved			UINT16	R/W	
Clock Indication and Setup

+12, 13		Find key: End time, seconds since 1/1/1970	F1	sec	UINT32	R/W	Note 3
+14, 15		Find key: End time, fractional seconds in µsec		µsec	UINT32	R/W	Note 3
+16-31		Not used			UINT16	R/W	
63152-64943		File Response Block					
		Data transfer area [0 - 1791]			UINT16	R	
64944-64951		File Info Request Block					
+0		File function	9 = read file info		UINT16	R/W	
+1		File ID	F2		UINT16	R/W	
+2		Section number	0-31, 0xFFFF = use channel ID		UINT16	R/W	
+3		Section channel ID	F6, F7		UINT16	R/W	
+4		Not used	0		UINT16	R/W	
+5		Request variation	0, 1, 2		UINT16	R/W	
+6-7		Not used			UINT16	R/W	
64952-65151		File Info Response Block					
		Data transfer area [0 - 199]			UINT16	R	

NOTES:

1. File sections for partitioned (multi-section) files, like Summary/TOU profile log files, can be requested either by a section number, or by a section channel ID. If a section number is set to 0xFFFF, the section channel ID will be used to identify the section. The section number will be returned in the response block. If a section number is written, then the corresponding channel ID will be returned in the file response block.
2. The record sequence number with function 11 (Read-File) does not change the file position and is used only as a reference to track the order of records. The file transfer block will continue to hold the same data until it is acknowledged, or until the file position is explicitly moved to another record. For multi-section, the Read-File request, which addresses a different file section, will refill the transfer block with data of the record from the requested file section with the identical sequence number. After acknowledgment, the file position will be moved to the next record.
3. Function 7 (Find) puts into the file request block the sequence number of the first record in the file that matches the event time. Any one of the find keys can be omitted by setting it to 0. If one or a number of find keys are omitted, the device will use the remaining keys to locate the matching record. If the record could not be found, the device responds to the write request with the exception code 3 (illegal data). The status of the operation can be read through the file status word in the file info block.

File Response Blocks

¹ To restore the original sampled data in the channel units (e.g., Volts, Amps), the following conversion should be applied:

$$\text{Sampled Data [primary units]} = \frac{(\text{Data Sample} - \text{Channel Offset}) \times \text{Channel Multiplier}}{\text{Channel Divisor}}$$

NOTES:

1. If a file is read through a TCP connection, your assignments for the transfer will be effective only within the current connection socket. Since the device cannot guarantee that your next connection will be made through the same socket, you should not make any assumptions regarding the present block settings. When you open a new connection, always check the file status and pointers before reading file records.
2. When the 4LN3 or 3LN3 wiring mode is selected, the voltages will be line-to-neutral; for any other wiring mode, they will be line-to-line.

¹ An energy use profile section is allocated for registers for which a source input is selected in the Energy/TOU Register setup and for which energy use profile is enabled. A maximum demand profile section is allocated for registers for which maximum demand profile is enabled in the Energy/TOU Register setup. Not configured sections/channels are not available for download. Refer to the file channel mask in the file info for configured channels.

² The number of parameters in a section is automatically configured depending on the number of actually used tariffs selected in the TOU Daily Profiles.

³ For power scale and units, refer to Section 4 "Data Scales and Units".

¹ An energy use profile section is allocated for registers for which a source input is selected in the Energy/TOU Register setup and for which energy use profile is enabled. A maximum demand profile section is allocated for registers for which maximum demand profile is enabled in the Energy/TOU Register setup. Not configured sections/channels are not available for download. Refer to the file channel mask in the file info for configured channels.

² The number of parameters in a section is automatically configured depending on the number of actually used tariffs selected in the TOU Daily Profiles.

³ For power scale and units, refer to Section 4 "Data Scales and Units".

3.15 Energy Load Profile Data Log

File Section	Record Field No. ¹	Point Label	Point ID	Description	Range	Units	Type	Notes
0	1	REG1	0x1780	Summary (total) energy register 1 reading	0-999,999,999	0.1 kWh	UINT32	
	2	REG2	0x1781	Summary (total) energy register 2 reading	0-999,999,999	0.1 kWh	UINT32	
	3	REG3	0x1782	Summary (total) energy register 3 reading	0-999,999,999	0.1 kWh	UINT32	
	4	REG4	0x1783	Summary (total) energy register 4 reading	0-999,999,999	0.1 kWh	UINT32	
	5	REG5	0x1784	Summary (total) energy register 5 reading	0-999,999,999	0.1 kWh	UINT32	
	6	REG6	0x1785	Summary (total) energy register 6 reading	0-999,999,999	0.1 kWh	UINT32	
	7	REG7	0x1786	Summary (total) energy register 7 reading	0-999,999,999	0.1 kWh	UINT32	
	8	REG8	0x1787	Summary (total) energy register 8 reading	0-999,999,999	0.1 kWh	UINT32	
	9	REG9	0x1788	Summary (total) energy register 9 reading	0-999,999,999	0.1 kWh	UINT32	
	10	REG10	0x1789	Summary (total) energy register 10 reading	0-999,999,999	0.1 kWh	UINT32	

¹ The number of parameters in a file is automatically configured depending on the number of registers for which a source input is selected in the Energy/TOU Register setup.

4 Data Scales and Units

Code	Condition	Value	Range	Notes
Data Scales				
Vmax		Voltage scale × PT Ratio, V		2
I _{max}		Current Scale × CT Ratio ¹ , A		3
I _{4max}		Current Scale × I ₄ CT Ratio ¹ , A		3
Pmax		Vmax × I _{max} × 2, W		4
Fmax		100 Hz		
AI _{min} AI _{max}	+/-1mA	AI _{min} = -AI full scale × 2 AI _{max} = AI full scale × 2		
	0-20mA	AI _{min} = AI zero scale AI _{max} = AI full scale		
	4-20mA	AI _{min} = AI zero scale AI _{max} = AI full scale		
	0-1mA	AI _{min} = AI zero scale AI _{max} = AI full scale		
Data Units				
U1	PT Ratio = 1	0.1 V		
	PT Ratio > 1	1 V		
U2		0.01 A	0 to 2×CT primary current	
U3	PT Ratio = 1	1 W/Var/VA		
	PT Ratio > 1	1 kW/kvar/kVA		
U4		0.01 A	0 to 10×CT primary current	

¹ CT Ratio = CT primary current/CT secondary current

² The default Voltage scale is 144V (120V +20%). You can change it via the Device Data Scale setup (see Section 3.1) or via the Device Options setup in PAS.

³ The default Current scale is 2 × CT secondary current (2 × 1A or 2 × 5A depending on the order).

⁴ Pmax is rounded to whole kilowatts. With PT=1.0, if Pmax is greater than 9,999,000 W, it is truncated to 9,999,000 W.

5 Data Formats

Format Code	Value	Description	Notes
Timestamp			
F1		Local time in a UNIX-style format. Represents the number of seconds since midnight (00:00:00), January 1, 1970. The time is valid after January 1, 2000.	
File ID			
F2	0	Event log	
	1-8	Data log #1-8	
	9	Data log #9 – EN50160 Compliance Statistics	
	10	Data log #10 – EN50160 Harmonic Survey Statistics	
	11	Data log #11	
	12	Data log #12 – Energy Load Profile log	
	13	Data log #13 – Fault RMS Profile log	
	14	Data log #14 – PQ RMS Profile log	
	15	Data log #15 – Energy/TOU Monthly Profile log	
	16	Data log #16 – Energy/TOU Daily Profile log	
	17-19	Waveform log #1-3	
	26	Power quality (PQ) event log	
	27	Fault event log	
	128	Real time waveform capture	
File Attributes			
F3	Bit 0 = 0	Non-wrap file (stop when full)	
	Bit 0 = 1	Wrap-around (circular) file	
	Bit 1 = 1	Fixed (non-changeable) file attributes	
	Bits 4:6 =	Multi-section data log file attributes:	
	0	Regular file	
	1	Energy/TOU Monthly Profile log	Multi-section file
	2	Energy/TOU Daily Profile log	Multi-section file
	3	EN50160 Compliance Statistics	Multi-section file
4	EN50160 Survey Statistics - Voltage Harmonics	Multi-section file	
File Status Word (bitmap)			
F4	Bit 0 = 1	The last record of the file is being read	
	Bit 8 = 1	File is empty	
	Bit 9 = 1	Reading after EOF	
	Bit 10 = 1	Corrupted record (CRC error)	
	Bit 11 = 1	No file section found for the requested channel	
	Bit 12 = 1	Reading after the end of a data block	
	Bit 13 = 1	File is not accessible	
	Bit 14 = 1	Record not found	
Bit 15 = 1	Generic read error (with one of the bits 8-14)		
File Record Status Word (bitmap)			
F5	Bit 0 = 1	The last record of the file is being read	
	Bit 8 = 1	File is empty	
	Bit 9 = 1	Reading after EOF	
	Bit 10 = 1	Corrupted record (CRC error)	
	Bit 11 = 1	No file section found for the requested channel	
	Bit 12 = 1	Reading after the end of a data block	
	Bit 13 = 1	File is not accessible	
	Bit 14 = 1	Record not found	
Bit 15 = 1	Generic read error (with one of the bits 8-14)		
TOU Profile Log Channel ID			
F6	0-9	Summary/TOU energy usage registers #1-#10	
	16-25	Summary/TOU maximum demand registers #1-#10	
Waveform Log Channel ID			
F7	0	Channel V1/V12	1
	1	Channel V2/V23	1
	2	Channel V3/V31	1
	3	Channel V4 (neutral-ground)	
	4	Channel I1	
	5	Channel I2	
	6	Channel I3	
	7	Channel I4	
Profile Log Sections Mask			
F8	Bit 0:7 = 1	Summary/TOU energy usage registers #1-#8	

Format Code	Value	Description	Notes
	Bit 16:23 = 1	Summary/TOU maximum demand registers #1-#8	
Waveform Log Channel Mask			
F9	Bit 0 = 1	Channel V1/V12	1
	Bit 1 = 1	Channel V2/V23	1
	Bit 2 = 1	Channel V3/V31	1
	Bit 3 = 1	Channel V4 (neutral-ground)	
	Bit 4 = 1	Channel I1	
	Bit 5 = 1	Channel I2	
	Bit 6 = 1	Channel I3	
	Bit 7 = 1	Channel I4	
TOU Tariff Change Time			
F10	Bits 8:15 = 0-7	Tariff number #1-#8	
	Bits 2:7 = 0-23	Tariff start hour	
	Bits 0:1 = 0-3	Tariff start quarter of an hour	
Summary/TOU Energy Register Source ID			
F11	0x0000	None	
	0x0700-0x0707	Pulse input DI1-DI8	
	0x1700	kWh import	
	0x1701	kWh export	
	0x1704	kvarh import	
	0x1705	kvarh export	
	0x1708	kVAh	
	Setpoint Trigger Parameters ID		
F12	0x0000-0xFFFF	Any data point ID excluding energy counters	See Section 3.4
	0x1200-0x120F	External trigger #1-#16 (UDP broadcast trigger message)	
Setpoint Relational Operator			
F13	0 = NONE	None (with pulsed events)	
	1 = GREATER OR EQUAL	Analog value or counter is over the operate limit	
	2 = LESS OR EQUAL	Analog value or counter is under the operate limit	
	3 = EQUAL	Analog value or counter is equal to the operate limit	
	4 = NOT EQUAL	Analog value or counter is not equal to the operate limit	
	5 = ON	Binary status is 1/ON	
	6 = OFF	Binary status is 0/OFF	
Setpoint Action ID			
F14	0x0000	No action	
	0x2000-0x2007	Set user event flag #1-#8	
	0x2100-0x2107	Clear user event flag #1-#8	
	0x3000-0x3003	Operate relay RO1-RO4	
	0x3100-0x3103	Release latched relay RO1-RO4	
	0x4000-0x4007	Increment counter #1-#8	
	0x4200-0x4207	Clear counter #1-#8	
	0x6100	Reset all total maximum demand registers	
	0x6101	Reset maximum power demand registers	
	0x6102	Reset maximum volt and ampere demand registers	
	0x6103	Reset maximum volt demand registers	
	0x6104	Reset maximum ampere demand registers	
	0x6105	Reset maximum harmonic demand registers	
	0x6300	Reset Billing/TOU maximum demands	
	0x6400	Clear all counters	
	0x6500	Clear Min/Max log registers	
	0x7000	Event log on setpoint operated	
	0x7001	Event log on setpoint released	
	0x7002	Event log on any setpoint transition	
	0x7100-0x710D	Data log #1-#14	
0x7200-0x7201	Waveform Log #1-#2		
Counter Source ID			
F16	0x0000	None	
	0x0001-0x0008	Pulse input DI1-D8	
Relay Output Pulse Source ID			
F17	0x0000	None	
	0x0400	kWh import pulse	
	0x0401	kWh export pulse	
	0x0403	kvarh import pulse	
	0x0404	kvarh export pulse	
	0x0405	kvarh total pulse	
	0x0406	kVAh pulse

	Bit 26	Reserved	
	Bit 27 = 1	Magnetic interference	
	Bit 28	Reserved	
	Bit 29 = 1	Motion/tilt sensor	
	Bit 30 = 1	Circuit fault	
	Bit 31	Reserved	
DNP Object Types			
F24		Static Binary Input Objects	
	0	Single-Bit Binary Input	
	1	Binary Input With Status	
		Binary Input Change Event Objects	
	0	Binary Input Change Without Time	
	1	Binary Input Change With Time	
		Static Binary Counters	
	0	32-bit Binary Counter	
	1	32-bit Binary Counter Without Flag	
	2	16-bit Binary Counter	
	3	16-bit Binary Counter Without Flag	
		Binary Counter Change Events	
	0	32-bit Counter Change Event Without Time	
	1	32-bit Counter Change Event With Time	
	2	16-bit Counter Change Event Without Time	
	3	16-bit Counter Change Event With Time	
		Frozen Binary Counters	
	0	32-bit Frozen Counter	
	1	32-bit Frozen Counter Without Flag	
	2	32-bit Frozen Counter With Time of Freeze	
	3	16-bit Frozen Counter	
	4	16-bit Frozen Counter Without Flag	
	5	16-bit Frozen Counter With Time of Freeze	
		Static Analog Input Objects	
	0	32-bit Analog Input	
	1	32-bit Analog Input Without Flag	
	2	16-bit Analog Input	
	3	16-bit Analog Input Without Flag	
		Analog Input Change Events	
	0	32-bit Analog Change Event Without Time	
	1	32-bit Analog Change Event With Time	
	2	16-bit Analog Change Event Without Time	
	3	16-bit Analog Change Event With Time	
DNP Class 0 Objects			
F25	0x1E01	Analog Input 30:01	

Format Code	Value	Description	Notes
	0x1E02	Analog Input 30:02

Wiring Mode			
F26	0	3OP2 - 3-wire open delta using 2 CTs (2 element)	
	1	4LN3 - 4-wire WYE using 3 PTs (3 element), line-to-neutral voltage readings	
	2	3DIR2 - 3-wire direct connection using 2 CTs (2 element)	
	3	4LL3 - 4-wire WYE using 3 PTs (3 element), line-to-line voltage readings	
	4	3OP3 - 3-wire open delta using 3 CTs (2 1/2 element)	
	5	3LN3 - 4-wire WYE using 2 PTs (2 1/2 element), line-to-neutral voltage readings	
	6	3LL3 - 4-wire WYE using 2 PTs (2 1/2 element), line-to-line voltage readings	
Factory Device Options (bitmap)			
F27	0	Fast transient overvoltage option (special order)	
	1-31	Not used	

NOTES:

¹ Voltage

When the 4LN3 or 3LN3 wiring mode is selected, the voltages and voltage waveforms will be line-to-neutral; for any other wiring mode, they will be line-to-line.

² Analog Outputs

1) For bi-directional analog output (± 1 mA), the zero scale setup corresponds to the center (0 mA) of the scale range, and the direction of the current matches the sign of the output parameter. Unsigned parameters are output within the current range 0 to +1 mA and can be scaled as in the case of single-ended analog output (0-1 mA).

For signed values, such as powers and signed power factor, the scale is always symmetrical with regard to 0 mA, and the full scale corresponds to +1 mA output for positive readings and to -1 mA output for negative readings. The zero scale (0 mA output) is permanently set in the instrument to zero for all parameters except the signed power factor for which it is set to 1.000 (see Note 2). In write requests, the zero scale is ignored.

2) Except for the signed power factor, the setup scale is continuous within the entire value range. For signed power factor, the setup scale is broken at +1.000 in order to provide continuous output current when the power factor changes close to ± 1.000 . The setup scale is symmetrical in the range of -0 to +0 with a center at 1.000 (-1.000 is assumed to be equal to +1.000). Negative power factor is output as -1.000 minus measured value, and non-negative power factor is output as +1.000 minus measured value. To set the entire range for power factor from -0 to +0, the scales would be specified as -0 to 0. Because of the fact that negative zero may not be transmitted through communications, the value of -0.001 is used to specify the scale of -0, and both +0.001 and 0.000 are used to specify the scale of +0.

³ The event value field shows the present meter time in the F1 format (starting with V26.1.2).

⁴ The event value field shows the server IP address in a network byte order.
