# 1 General

The PM180 is provided with an embedded IEC 61850 server compliant with the IEC 61850 set of standards.

This document contains the IEC 61850 conformance statements that give the summary of the device data object model, protocol implementations and communication capabilities of the PM180.

For detailed information on operating the PM180 and communication settings refer to the PM180 Operation Manual.

## IMPORTANT

Control commands addressed to the CSWI switch controller nodes and to the boGGIO general binary output nodes will be rejected until the internal BOOLEAN variable REMOTE MODE is set to TRUE via a setpoint logic equation. See Controls in Section 5.3 for details.

## 2 ACSI (Abstract Communication Service Interface) Conformance Statement

This chapter contains the ACSI conformance statement as defined in Annex A of IEC 61850-7-2 that specifies the device communication features mapped to an SCSM (Specific Communication Service Mapping).

### 3 MICS - Model Implementation Conformance Statement

This chapter contains the MICS conformance statement as required by IEC 61850-10. It lists data object model elements supported by the PM180 and provides definitions of the logical nodes, common data classes and data attribute types as defined in IEC 61850-7-3 and IEC 61850-7-4.

#### 3.1 Model conformance

The model conformance of the PM180 is described by its ICD file.

#### 3.2 Common data attributes classes

The following tables indicate which fields are supported in each Common Data Attribute Class. Not listed fields are either optional (O) or conditional (C) and are not supported by the PM180. Mandatory fields (M) are always present.

##### Quality

Attribute name	Attribute type	Value/Range	M/O/C	Comments
validity	CODED ENUM	good   invalid	M	Supported
detailQual	PACKED LIST		M	Supported
overflow	BOOLEAN	FALSE	M	Defaulted
outOfRange	BOOLEAN	TRUE   FALSE	M	Supported
badReference	BOOLEAN	TRUE   FALSE	M	Supported
oscillatory	BOOLEAN	FALSE	M	Defaulted
failure	BOOLEAN	TRUE   FALSE	M	Supported
oldData	BOOLEAN	FALSE	M	Defaulted
inconsistent	BOOLEAN	FALSE	M	Defaulted
inaccurate	BOOLEAN	FALSE	M	Defaulted
source	CODED ENUM	process	M	Defaulted
test	BOOLEAN	FALSE	M	Defaulted
operatorBlocked	BOOLEAN	FALSE	M	Defaulted

##### Analog value

Attribute name	Attribute type	Value/Range	M/O/C	Comments
i	INT32	integer value	C	
f	FLOAT32	floating point value	C	

Only one of the attributes may be present for a given instance of DATA.

##### Configuration of analogue value

Common data attribute class is not supported.

##### Range configuration

Common data attribute class is not supported.

##### Step position with transient indication

Common data attribute class is not supported.

## Pulse configuration

Attribute Name	Attribute Type	Value/Range	M/O/C	Comments
cmdQual	ENUMERATED	pulse   persistent	M	For boGGIO pulse output, a relay must be set to pulse mode via the device Relay Setup
onDur	INT32U		M	boGGIO class nodes: default = 2000 ms CSWI class nodes: default = 0
offDur	INT32U		M	Not supported
numPls	INT32U	1	M	Read only

## Originator

Attribute Name	Attribute Type	Value/Range	M/O/C	Comments
orCat	ENUMERATED	not-supported   bay-control   station-control   remote-control   automatic-bay   automatic-station   automatic-remote   maintenance   process	M	
orIdent	OCTET STRING64		M	

## Unit definition

Attribute Name	Attribute Type	Value/Range	M/O/C	Comments
SIUnit	ENUMERATED	See IEC61850-7-3, Tables A.1 to A.4 in Annex A	M	
multiplier	ENUMERATED	See IEC61850-7-3, Table A.5 in Annex A	O	

The default value of the multiplier is 0 and the multiplier value is 1:  $10^{*0} = 1$ .

## Vector

Attribute Name	Attribute Type	Value/Range	M/O/C	Comments
mag	AnalogueValue		M	Only one of the attributes of the AnalogueValue may be present for a given instance of DATA.
ang	AnalogueValue		O	ang attribute is used for data objects of the phzrMMXU LN only (see below)

## Point definition

Common data attribute class is not supported.

## CtlModels definition

Attribute Value	Comments
status-only	Not controllable SPS, DPS and INS
direct-with-normal-security	Controllable SPC. Supported by boGGIO and evfGGIO class nodes.
sbo-with-normal-security	Controllable SPC. Supported by boGGIO and evfGGIO class nodes.
direct-with-enhanced-security	Controllable DPC. Supported by CSWI class nodes.
sbo-with-enhanced-security	Not supported

## SboClasses definition

Attribute Value	Comments
operate-once	
operate-many	Not supported

### 3.3 Common data classes

The following tables indicate mandatory, conditional and optional attributes of each Common Data Class (CDC) that are supported by the PM180. Mandatory attributes (M) are always present.

Relay output operation depends on the configurable cmdQual attribute value (see pulseConfig) and the relay operation mode configured in the device via the Relay Setup as described in the following table.

cmdQual	Relay operation mode	Relay output operation
pulse	Pulse/KYZ	Pulse output. ctIVal = 1 – generates a pulse (normal/KYZ) with a duration defined by the onDur attribute; ctIVal = 0 – no effect
pulse	Latched/unlatched	No effect
persistent	Pulse/KYZ	Pulse output. ctIVal = 1 – generates a pulse (normal/KYZ) with a duration defined by the pulse width pre-configured in the device setup; ctIVal = 0 – no effect
persistent	Latched/unlatched	Latched output. ctIVal = 1 – switch on, ctIVal = 0 – switch off

### Controllable double point (DPC)

Applied to CSWI class nodes.

## 3.4 Logical devices and logical nodes

The PM180 IEC 61850 server provides a single logical device MET1.

The PM180 IEC 61850 server provides two logical devices CTRL and MET1 described in the following table. The domain name of a logical device can incorporate a configurable IED name (see Section 6.2) that will precede a logical device name.

Logical device	Description
CTRL	Bay control elements – breaker and switch control
MET1	Metering, measurements and general digital input and output elements

Logical devices contain logical nodes LPHD and LLNO dedicated to the PM180 unit, and a set of functional logical nodes for functions supported by the PM180. Logical node names are fixed.

The following tables describe attributes of logical nodes. Not listed attributes are either optional (O), or conditional (C) and are not supported by the PM180. Mandatory (M) attributes are always present.

The PM180 also uses extension (E) attributes for some logical nodes.

## 4 PICS – Protocol Implementation Conformance Statement

This chapter contains the PICS conformance statement as defined by IEC 61850-8-1 that specifies mapping to MMS and to ISO/IEC 8802-3.

### 4.1 Profile conformance

#### A-Profile support

Profile	Profile description type	Client/Subscriber	Server/Publisher	Comments
A1	Client/server		Yes	
A2	GOOSE/GSE Management		Yes	SendGOOSEMessage only
A3	GSSE			
A4	Time sync	Yes		SNTP (RFC 2030, RFC 4330)

#### T-Profile support

Profile	Profile description type	Client/Subscriber	Server/Publisher	Comments
T1	TCP/IP profile		Yes	
T2	OSI T profile			
T3	GOOSE/GSE profile	Yes	Yes	
T4	GSSE T profile

## 5 PIXIT - Protocol Implementation Extra Information for Testing

This chapter describes device specific implementation of the protocol and communication capabilities of the PM180.

### 5.1 Device configuration

The device configuration except of the listed items cannot be modified and is listed for information only.

### 5.2 ACSI models

#### Association model

Item	Value/Comments
Maximum simultaneous client associations	4
TCP Keepalive	120-600 s, configurable
Authentication	Not supported
Association parameters	
TSEL	0001, fixed value
SSEL	0001, fixed value
PSEL	00000001, fixed value
AP-Title	Not required, ignored if present
AE-Qualifier	Not required, ignored if present
Maximum MMS PDU size	16000
Typical startup time after a power supply interrupt	5 s

#### Server model

Item	Value/Comments
Quality bits for analog values (MX)	
Validity	Good
OutOfRange	Not supported
Failure	Not supported
Inconsistent	Not supported

### Report service information

Any predefined RCB attribute value may be written when RptEna is FALSE. Only existing data sets (see Dataset model table) may be used for DatSet attribute changing. Internal events, caused by data-change and quality-change trigger options only, result in immediate sending of reports or buffering events for transmission (limited by a buffer size of 1000 bytes per report).

## GOOSE Publisher model

Item	Value/Comments
Maximum number of supported GOOSE data sets	1 (fixed)
Maximum data change detection delay	8 ms @ 60Hz/10 ms @ 50Hz
Initial retransmission interval	8 ms @ 60Hz/10 ms @ 50Hz for the first 5 messages
Maximum retransmission interval	Configurable from 0.5 s to 60 s
Publisher retransmission strategy	Geometric with a time multiplier of 2 after the 5th message
Declared message timeAllowedToLive time	Twice the message retransmission interval + 10 ms

## GOOSE Subscriber model

Item	Value/Comments
Maximum number of GOOSE subscriptions	20
Maximum number of GOOSE data set items	16 per subscription
Supported types of GOOSE data set items	Bstring32, Bstring16, Bstring8, FLOAT32, INT32, INT16, INT8, BOOLEAN, Dbpos
Mapping external GOOSE data set objects to internal variables	External indication: - 128 variables of BOOLEAN (ExtInd1... ExtInd128) External measured values: - 32 variables of INT32 (ExtiVal1 – ExtiVal32) - 32 variable of FLOAT32 (ExtfVal1 – ExtfVal32)
Filters used to identify subscribed GOOSE messages	Destination MAC address, ETHERTYPE, APPID.
Subscriber behavior in case of mismatching GOOSE header parameters (confRev, numDatSetEntries)	All expected data objects are invalidated and zeroed.
Subscriber behavior in case of missing a GOOSE message within the timeAllowedToLive time	All expected data objects are invalidated and zeroed.

	updated from any external time source or via communications.
Meaning of ClockNotSynchronized bit	The bit is set in the event of using unsynchronized internal clock for time stamping in the following cases: a) if none of the external time sources is selected for time synchronization b) if no valid time synchronization message arrives in 10 minutes after the expected time from either a SNTP server, or from the IRIG-B time code input
Number of SNTP servers supported	2
SNTP polling interval	Programmable, 60 to 86400 seconds
Allowable SNTP server response time	10 seconds
Number of SNTP connection retries for each server	Up to 3 retries in 1 minute intervals
Failed SNTP server reconnection time	10 minutes

Maximum length of names (incl. path)	64
Separator for file and directories path	'\'
Maximum number of directory entries	10 per recorder (the last 10 events recorded, starting from the newest record)
Structure of directories	COMTRADE\filename
Filename structure	drRDRE<1...8>\$.<fault number>\$.<trigger event ID>.cfg drRDRE<1...8>\$.<fault number>\$.<trigger event ID>.dat

## 5.3 Impact of the device settings

### Logical device mode

Logical device mode given by LLNO.Mod is always ON.

### Controls

The Loc attribute in logical nodes containing controls indicates the complementary status of the internal BOOLEAN variable REMOTE MODE defaulted to FALSE. It is controlled via a setpoint logic equation that should normally check the status of an external Local/Remote switch. Control commands addressed to the CSWI switch controller nodes and to the boGGIO general binary output nodes will be rejected with AddCause=2 Blocked-by-switching-hierarchy until REMOTE MODE is set to TRUE via a logic equation.

The PM180 can provide additional protection for control nodes based on client IP addresses by enabling control commands for specific clients and disabling or conditional blocking via logic equations for others. Commands received from a blocked client port are rejected with AddCause=2 Blocked-by-switching-hierarchy.

### Measurement units

Voltage, current and power units are selectable (see Section 6.2 for details).

Measurement type	Units (precision)	
	PT = 1	PT > 1
Current	A/kA (0.01 A)	A/kA (0.01 A)
Voltage AC	V/kV (0.1 V)	V/kV (1 V)
Power	kW, kVA, kvar or MW, Mvar, MVA (0.001 kW/kVA/kvar)	kW, kVA, kvar or MW, Mvar, MVA (1 kW/kVA/kvar)
Energy	0.001/0.01/0.1/1 kWh, kVAh, kvarh	0.001/0.01/0.1/1 kWh, kVAh, kvarh

## Process Measurement Limits

Measurement type	Measurement limits		
	Condition	min	max
Current (standard inputs)		0	Current Scale $\times$ CT Ratio <sup>1, 2</sup> (I <sub>max</sub> )
Auxiliary current I4 (standard input)		0	Current Scale $\times$ I4 CT Ratio <sup>1, 2</sup>
Current (extended inputs)		0	20 $\times$ CT Primary current
Auxiliary current I4x (extended input)		0	20 $\times$ I4 CT Primary current
Voltage AC		0	Voltage Scale $\times$ PT Ratio <sup>3</sup> (V <sub>max</sub> )
Auxiliary voltage V4		0	Voltage Scale $\times$ V4 PT Ratio <sup>3</sup>
Power signed (kW, kvar)		-V <sub>max</sub> $\times$ I <sub>max</sub> $\times$ 2/1000	V <sub>max</sub> $\times$ I <sub>max</sub> $\times$ 2/1000 <sup>4</sup>
Power unsigned (kVA, kW import/export, kvar import/export) and power demands		0	V <sub>max</sub> $\times$ I <sub>max</sub> $\times$ 2/1000 <sup>4</sup>
Power factor signed		-1.000	1.000
Power factor unsigned (lag, lead)		0	1.000
Analog inputs	+/-1mA	-AI full scale $\times$ 2	AI full scale $\times$ 2
	0-20mA	AI zero scale	AI full scale
	4-20mA	AI zero scale	AI full scale
	0-1mA	AI zero scale	AI full scale
	0-50mA	AI zero scale	AI full scale $\times$ 2
	+/-10V	-AI full scale	AI full scale
Unbalance		0	300.0
THD		0	999.9
TDD		0	999.9
K-Factor		1.0	999.9
Harmonics		0	100.00

### NOTES:

1. CT Ratio = CT primary current/CT secondary current.
2. The default Current Scale is 4  $\times$  CT secondary current for devices with a 400% overload (ANSI) or 2  $\times$  CT secondary current for devices with a 200% overload (IEC). It can be changed via the Device Options setup in PAS.
3. The default Voltage Scale is 828V. It can be changed via the Device Options setup in PAS.
4. If PT Ratio = 1.0 and P<sub>max</sub> is greater than 9,999 kW, then it is truncated to 9,999 kW.

### Deadbands

The db value represents the percentage of difference between max and min process measurement limits indicated in the table above. The default db (deadband) attribute values in functional constraint CF are defined in the ICD file. They can be changed to provide reasonable conditions for generating reportable events.

### Textual descriptions

The default d (textual description of the data) attribute values in functional constraint DC are defined in the device. They can be changed for descriptions of measured/metered and status data.

## 6 Configuring IEC 61850

The PAS software supplied with the PM180 provides a configuration tool for customizing your device and generating a configured IED description (CID) file for use with IEC 61850 client applications. See the PM180 Operation Manual for more information on installation and operating PAS on your computer.

To reset the IEC 61850 settings to the factory defaults:

1. Select Administration->Master Reset from the Monitor menu.
2. Click the "Reset IEC 61850 Configuration" button, and then confirm the command.

### 6.1 Licensing IEC 61850

A valid license key must be provided in the PM180 for IEC 61850 communications. The device is normally shipped with a temporary license, which is valid for a 30-day operation and then can be extended for an additional month.

A permanent license can be obtained from your local distributor for an additional fee. A device serial number must be provided in the license request. The device may also be shipped with the permanent license in the event of a pre-paid fee.

To program a license key in you device:

1. Select Administration->Update License from the Monitor menu.

2. Type in the license code and click Send.

### 6.2 Configuring IED Properties

The IEC 61850 configurator allows you to configure the IED name, device location, measurement units and communication options, and to arrange a set of report control blocks for multi-client installations

To configure the IED properties in your device:

1. Select IEC 61850 Setup from the Meter Setup menu, and then click on the IEC 61850 IED Properties tab.
2. Configure IED options for your application as required.

#### NOTES

- The configured IED name accompanies logical device names in object references.
- The device location also identifies the substation location in COMTRADE configuration files as the station\_name attribute.
- Attributes marked with the asterisk cannot be changed in the device via this setup but you can define and store them to the device database when working offline to use for updating a device CID file.
- The number of RCB instances defines how pre-defined RCBs are arranged in the device for use in multi-client applications. The RCBs are automatically pre-configured in the device in the way indicated in Section "Reporting model". The RCB names and report IDs are set to defaults as the number of RCB instances changes. If you intend to change the default setting, set it first before configuring report control blocks.

3. Send your setup to the device and save it to the device database.

## 6.3 Configuring Datasets

To review or configure the IEC 61850 datasets:

1. Select IEC 61850 Setup from the Meter Setup menu, and then click on the IEC 61850 Datasets tab.
2. Select a dataset you wish to view or configure in the "Dataset Reference" box. Select "New Dataset" to create a new dataset.
3. To delete dataset members, uncheck the appropriate "Included" boxes. Uncheck all dataset members to delete the entire dataset.
4. To add or change dataset members, click "Edit from file", locate the PM180.icd template file or a CID file you generated for your device, and click Open.

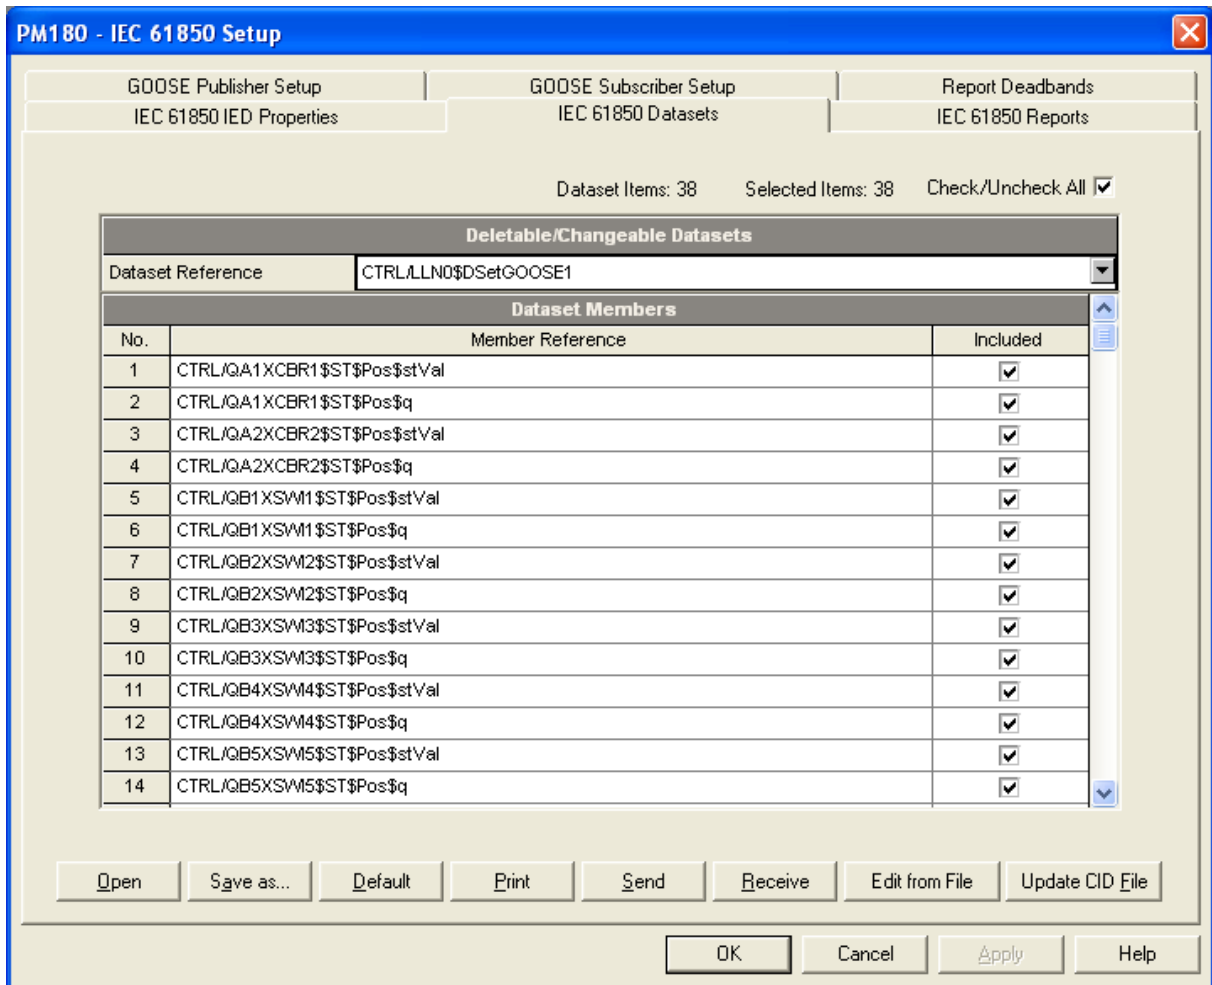

A full list of the available data objects and data attributed is displayed, where included dataset members are checked.

To create a new dataset, select a logical device where the dataset will be located and type a dataset name in the "Dataset Name" box.

Check the "Included" boxes for items you wish to be members of the dataset and click OK.

To make easy selection of items across the list, use filters - functional constraints or/and a selected logical device/logical node. Click "Filter checked" to see and revise a list of the selected items.

5. Send your new setup to the device and save it to the device database.

## 6.4 Configuring Report Control Blocks

To configure Report Control Blocks in your device:

1. Select IEC 61850 Setup from the Meter Setup menu, and then click on the IEC 61850 Reports tab.

The screenshot shows the 'PM180 - IEC 61850 Setup' dialog box. The 'IEC 61850 Reports' tab is selected. A central window titled 'RCB #1 - Unbuffered Report Control Block' displays the following configuration:

RCB #1 - Unbuffered Report Control Block	
RCB Reference	MET1ALLNO\$RP\$URep01
Report ID	MET1ALLNO\$RP\$URep01
Enabled	----
Reserved	----
Dataset Reference	MET1ALLNO\$DSet01Mx
Configuration Revision	1
Optional Fields	0111110000
Buffer Time	----
Sequence Number	----
Trigger Options	011000
Integrity Period, ms	0

Buttons at the bottom of the dialog include: Open, Save as..., Default, Print, Send, Receive, Update CID File, OK, Cancel, Apply, and Help.

2. Select an RCB you wish to view or configure in the "RCB Reference" box.
3. Configure the RCB attributes as required for your application. The following items can be configured:
  - Report ID
  - Dataset reference (can be selected from the available datasets list)
  - Optional fields
  - Trigger options
  - Integrity period for periodic reports with the integrity trigger option selected

To change the Optional fields or Trigger options, click the arrow button at the right to the item, check the appropriate options and click OK.

### NOTE

Configure your new and customized datasets and update them in the device, or save to the device database if you work offline, before configuring reports; otherwise you may get an incomplete dataset list.

4. Send your new setup to the device and save it to the device database.

## 6.5 Configuring the GOOSE Publisher

The PM180 GOOSE publisher provides the dedicated dataset CTRL/LLN0\$DSetGOOSE1 for GOOSE communications. The default dataset variables list can be modified via the IEC 61850 Datasets setup (see Section 6.3).

To configure the GOOSE publisher:

1. Select IEC 61850 Setup from the Meter Setup menu, and then click on the GOOSE Publisher Setup tab.
2. Configure the destination MAC address, application ID and the maximum message retransmission interval as required for your application. Other setup attributes are not changeable and are indicated for information only.
3. Select Yes in the Publisher Enabled box to enable publisher operation.
4. Send your setup to the device.

The screenshot shows the 'PM180 - IEC 61850 Setup' dialog box with the 'GOOSE Publisher Setup' tab selected. The dialog has a blue title bar and a light beige background. At the top, there are three tabs: 'IEC 61850 IED Properties', 'IEC 61850 Datasets', and 'IEC 61850 Reports'. Below these, there are three sub-tabs: 'GOOSE Publisher Setup', 'GOOSE Subscriber Setup', and 'Report Deadbands'. The main area contains a table with the following data:

GOOSE Publisher	
GOOSE CB Reference	CTRL/LLN0\$GO\$GoCBPub1
Publisher Enabled	NO
GOOSE ID	Pub1
Dataset Reference	CTRL/LLN0\$DSetGOOSE1
Configuration Revision	1
Needs Commissioning	NO
Destination MAC Address	01:0C:CD:01:01:FF
Priority	4
VLAN ID	0
Application ID	3001
Max. Retransmission Interval, ms	5000

At the bottom of the dialog, there are several buttons: 'Open', 'Save as...', 'Default', 'Print', 'Send', 'Receive', 'Update CID File', 'OK', 'Cancel', 'Apply', and 'Help'.

## 6.6 Configuring the GOOSE Subscriber

The PM180 can be subscribed to messages sent by any GOOSE network device including both PM180 and non-SATEC devices.

The GOOSE subscriber supports up to 20 subscriptions with up to 16 data elements in each subscription. The location of the subscribed elements in GOOSE data sets and mapping to the PM180 internal variables are configurable. The subscription elements are selected from a publishing device's ICD/CID file.

The PM180 provides a set of internal variables for mapping external GOOSE data:

- a 128-bit binary string composed of 128 binary variables ExtInd1...ExtInd128 of type BOOLEAN called external indication and intended for mapping single-point BOOLEAN and integer elements and double-point Dbpos data;
- 32 variables ExtiVal1...ExtiVal32 of type INT32 for mapping signed and unsigned integer numbers of any size;
- 32 variables ExtfVal1...ExtfVal32 of type FLOAT32 for mapping single-precision floating point numbers.

When the subscriber receives GOOSE message updates, the subscribed data is copied to the internal variables that can be monitored and recorded in the device like any other measured value. When the subscriber does not receive updates, or the declared message live time has expired, or the data set differs from the subscriber setup, the internal variables are zeroed and the non-active status is indicated in the subscription status.

The subscription status can be monitored from an IEC 61850 client via the GOOSE subscriber logical nodes CTRL/sbsLGOS1-CTRL/sbsLGOS20, or from a Modbus client application via the GOOSE subscriber status register (see the PM180 Modbus Reference Guide for the register location).

To configure the GOOSE subscriber:

1. Select IEC 61850 Setup from the Meter Setup menu, and then click on the GOOSE Subscriber Setup tab.

2. In the Subscription Number box, select the subscription you wish to configure.
3. Click the "Open SCL File" button and open an ICD or CID file for the publishing device you wish to subscribe to. PAS shows you a list of all datasets linked to GOOSE publisher

control blocks that are found in the ICD/CID file. Check the Subscribe box for the dataset you wish to subscribe to.

- The publisher attributes and a list of dataset members for the selected dataset are displayed as shown in the picture below. PAS also indicates a basic IEC 61850 data element type and a physical MMS type for dataset members. Check the Subscribe boxes for elements you want to subscribe to, and then click OK.

You are allowed to select no more than 16 elements. Elements with incompatible data types are not allowed for selection.

The publisher attributes of the selected dataset and the selected data elements are copied to the current subscription.

Select compatible input variables to which dataset elements will be mapped in the device. See the table below for allowable mapping options depending on the basic variable type.

Basic Data Type	MMS Data Type	Compatible Input Variables
BitString32	Bstring32	ExtIInd, ExtiVal
Dbpos	Bstring8	ExtIInd, ExtiVal
Enum	INT8	ExtIInd, ExtiVal
INT32	INT32	ExtIInd, ExtiVal
INT32U	INT32U	ExtIInd, ExtiVal
INT16	INT16	ExtIInd, ExtiVal
INT16U	INT16U	ExtIInd, ExtiVal
INT8	INT8	ExtIInd, ExtiVal
INT8U	INT8U	ExtIInd, ExtiVal
BOOLEAN	BOOLEAN	ExtIInd, ExtiVal
FLOAT32	FLOAT32	ExtfVal

NOTES:

- Mapping integer data to a BOOLEAN ExtIInd variable results in copying a least-significant bit of the dataset member only.
  - Mapping double-point data of type Dbpos to a BOOLEAN ExtIInd variable causes a high-order bit of the dataset member to be copied to the following BOOLEAN ExtIInd variable.
5. Check the application ID, configuration revision and destination MAC address to meet the GOOSE publisher attributes.
  6. Select Yes in the Subscription Enabled box to activate the subscription.

- Repeat the setup for other subscriptions you wish to configure, and then send your setup to the device and save to the device database. Notice that dataset member names are not stored in the device and will not be displayed when reading the setup from the device unless you saved the setup in the device database on your PC.

## 6.7 Configuring Report Deadbands

Deadbands for reporting measured analog values can be configured at once via PAS without the need to setup individual deadbands for every data element. If required, you can then change deadbands for individual variables via your IEC 61850 application.

Downloading new report deadbands to the device changes deadbands for all analog data of the same type in all logical nodes, so it is recommended to do that before you make your individual deadband adjustments.

### NOTE

The process measurement scales for most analog values depend on your external PT and CT settings and on the voltage and current scales defined in the device. Configure them in your device and save to the device site database before changing report deadbands. See Basic Setup and Device Options Setup in the PM180 Operation Manual on how to configure these parameters in the device. See Programming Analog Inputs in the PM180 Operation Manual on how to setup the measurement scales for analog inputs.

To configure the deadbands for measured analog values:

- Select IEC 61850 Setup from the Meter Setup menu, and then click on the Report Deadbands tab.

Measured Value	Deadband, %	Deadband, units	Minimum Measurement	Maximum Measurement
Phase voltage, V	1.000	8280	0	828000
Auxiliary voltage V4, V	1.000	8.3	0.0	828.0
DC voltage, V	----	----	----	----

Active power import/export, kW	1.000	331	0	33120
Reactive power import/export, kvar	1.000	331	0	33120

For your convenience, PAS shows the deadbands both in percent and in engineering units, and also indicates the minimum and maximum process measurements from which the percent deadband is taken.

2. Adjust the default percent deadbands to the desired values as required for your application. The allowable range is 0.001% to 50.000%. Press Enter or click with the left mouse button elsewhere on the dialog window to update the engineering deadbands.
3. Send your setup to the device.

The following table shows the default factory-set deadbands for all measured analog values.

Measured Value	Default Deadband, %

## 6.8 Generating a CID File

Generating a new or updating a preconfigured CID file for your device is done separately for each configuration setup. The following order is recommended but not mandatory:

- IED properties
- Datasets
- Report control blocks
- GOOSE publisher setup

To create or update a device CID file:

1. Click the "Update CID file" button on the setup tab.
2. Locate a source ICD or CID file for your device you wish to update and click Open. Use the PM180.icd file provided with your device as a primary template file to create a new CID file, and then use your new file as a source to update remaining settings.
3. Select the folder and the name of the target CID file where to store your new configuration description and click Open. It may be the same CID file you used as the source.
4. Repeat this procedure for other configuration setups you wish to update.

#### NOTES

- In the event an RCB reference is used as the Report ID (the default setting for non-indexed RCBs), update the RCBs in a CID file after changing the IED name even if no changes to RCBs have been made to keep consistency with your device.
- Breaker/switch nodes prefixes are configured in a CID file as they are defined in the device database while updating the IED properties. If you change the default breaker/switch prefixes in your device via the Bay Control setup, save the setup to the device database, and then update the IED properties in a CID file even if no other properties have been changed.
