## TECHNICAL NOTE

## Analog Outputs

Introduction ..... 2
Analog Output 4-20 mA ..... 3
Analog Output 0-20 mA .....  .4
Analog Output 0-1 mA .....
Analog Output $\pm 1 \mathrm{~mA}$ .....  6
Analog Output 0-2 mA range (0-1 mA option with 100\% overload) .....  7
Analog Output $\pm 2 \mathrm{~mA}$ range ( $\pm 1 \mathrm{~mA}$ option with $100 \%$ overload) .....  8
Analog Output 0-3 mA range (0-1 mA option with 200\% overload) .....  9
Analog Output $\pm 3 \mathrm{~mA}$ range ( $\pm 1 \mathrm{~mA}$ option with $200 \%$ overload) ..... 10
Analog Output 0-5 mA range (0-1 mA option with 400\% overload) ..... 11
Analog Output $\pm 5 \mathrm{~mA}$ range ( $\pm 1 \mathrm{~mA}$ option with $400 \%$ overload) ..... 12
Calculation Examples ..... 13

SATEC meters may be equipped with optional analog outputs that are programmable to provide a current proportional to selected measured electrical parameters.
The devices can be ordered with one of the following analog output options:

- $0-20 \mathrm{~mA}$
- $4-20 \mathrm{~mA}$
- 0-1 mA/0-2 mA - 0-1 mA option with $100 \%$ overload (regular 0-1 mA order)
- $\pm 1 \mathrm{~mA} / \pm 2 \mathrm{~mA}- \pm 1 \mathrm{~mA}$ option with $100 \%$ overload (regular $\pm 1 \mathrm{~mA}$ order)
- 0-1 mA/0-3 mA - 0-1 mA option with $200 \%$ overload (special 0-1 mA order)
- $\pm 1 \mathrm{~mA} / \pm 3 \mathrm{~mA}- \pm 1 \mathrm{~mA}$ option with $200 \%$ overload (special $\pm 1 \mathrm{~mA}$ order)
- 0-1 mA/0-5 mA - 0-1 mA option with $400 \%$ overload (special 0-1 mA order)
- $\pm 1 \mathrm{~mA} / \pm 5 \mathrm{~mA}- \pm 1 \mathrm{~mA}$ option with $400 \%$ overload (special $\pm 1 \mathrm{~mA}$ order)

You can find complete setup instructions in the corresponding Installation and Operation Manual for your meter. The purpose of this document is to provide guidelines for calculation of analog output currents and corresponding measured (real) parameters.

See the following tables for analog output scales and formulas for calculating analog output currents. The default output scales can be changed via the analog output setup from the meter front panel or through the supplemental PAS software.

Note that the output scales for 0-1 mA and $\pm 1 \mathrm{~mA}$ analog outputs are always programmed for 0 mA and +1 mA regardless of the ordered current overload option ( $100 \%, 200 \%$ or $400 \%$ ). If you wish to use the entire output range of $2 \mathrm{~mA}, 3 \mathrm{~mA}$ or 5 mA , depending on your order, set the analog output scales in your device as follows:
$0-2 \mathrm{~mA}$ : set the 1 mA scale to $1 / 2$ of the required full scale output for uni-directional parameters, and set the 0 mA scale to the negative full scale and the 1 mA scale to zero for bi-directional parameters.
$\pm 2 \mathrm{~mA}$ : set the 1 mA scale to $1 / 2$ of the required full-scale output for both uni-directional and bi-directional parameters.
$0-3 \mathrm{~mA}$ : set the 1 mA scale to $1 / 3$ of the required full scale output for uni-directional parameters, and set the 0 mA scale to the negative full scale and the 1 mA scale to $1 / 3$ of the negative full scale for bi-directional parameters.
$\pm 3 \mathrm{~mA}$ : set the 1 mA scale to $1 / 3$ of the required full-scale output for both uni-directional and bi-directional parameters.
$0-5 \mathrm{~mA}$ : set the 1 mA scale to $1 / 5$ of the required full scale output for uni-directional parameters, and set the 0 mA scale to the negative full scale and the 1 mA scale to $1 / 5$ of the negative full scale for bi-directional parameters.
$\pm 5 \mathrm{~mA}$ : set the 1 mA scale to $1 / 5$ of the required full-scale output for both uni-directional and bi-directional parameters.

## Analog Output 4-20 mA

For using the entire output range of $\pm 5 \mathrm{~mA}$, set the 1 mA scale in your device to $1 / 5$ of the required full scale output for both uni-directional and bi-directional parameters.

## Calculation Examples

## Example 1

The meter is installed on a 24 kV power line with 400:5A current transformers and 24,000:120V potential transformers:
$\mathrm{I}_{\mathrm{p}}=\mathrm{CT}$ primary current $=400 \mathrm{~A}$ and 3 -phase
$\mathrm{K}=\mathrm{PT}$ ratio $=24000 / 120=200$.
Wiring configuration is $4 \mathrm{Ln} 3, \mathrm{n}=3$.
The full-scale analog output ranges are as follows:
Voltage:
Low voltage $\mathrm{V}_{\text {low }}=0 \mathrm{~V}$.
High voltage $V_{\text {high }}=144 \times \mathrm{K}=144 \times 200=28800 \mathrm{~V}$.
Current:
Low current $\mathrm{I}_{\text {low }}(0$ or 4 mA$)=0 \mathrm{~A}$,
High current $\mathrm{I}_{\text {high }}=2 \times \mathrm{I}_{\mathrm{p}}=2 \times 400=800 \mathrm{~A}$
Active and reactive power:
Low power $P_{\text {low }}=-n \times V_{\text {high }} \times I_{\text {high }} / 1000=-3 \times 28800 \times 800 / 1000=-69,120 \mathrm{~kW}(\mathrm{kvar})$
High power $P_{\text {high }}=n \times V_{\text {high }} \times I_{\text {high }} / 1000=3 \times 28800 \times 800 / 1000=69,120 \mathrm{~kW}(\mathrm{kvar})$
The programmable analog output scales should be as follows:

## Voltage:

Low scale, $0 \mathrm{~mA} / 4 \mathrm{~mA}$ (all ranges): 0 V .
High scale, $1 \mathrm{~mA} / 20 \mathrm{~mA}(4-20 \mathrm{~mA}, 0-20 \mathrm{~mA}, 0-1 \mathrm{~mA}, \pm 1 \mathrm{~mA}$ ranges $): \mathrm{V}_{\text {high }}=28800 \mathrm{~V}$.
High scale, $1 \mathrm{~mA}(0-2 \mathrm{~mA}, \pm 2 \mathrm{~mA}$ ranges $): \mathrm{V}_{\text {high }} / 2=28800 / 2=14400 \mathrm{~V}$.
High scale, $1 \mathrm{~mA}(0-3 \mathrm{~mA}, \pm 3 \mathrm{~mA}$ ranges $): \mathrm{V}_{\text {high }} / 3=28800 / 2=9600 \mathrm{~V}$.
Current:
Low scale, $0 \mathrm{~mA} / 4 \mathrm{~mA}$ (all ranges): 0 A .
High scale, $1 \mathrm{~mA} / 20 \mathrm{~mA}(4-20 \mathrm{~mA}, 0-20 \mathrm{~mA}, 0-1 \mathrm{~mA}, \pm 1 \mathrm{~mA}$ ranges $)$ : Ihigh $=800 \mathrm{~A}$.
High scale, 1 mA ( $0-2 \mathrm{~mA}, \pm 2 \mathrm{~mA}$ ranges): $\mathrm{I}_{\text {high }} / 2=800 / 2=400 \mathrm{~A}$.
High scale, 1 mA ( $0-3 \mathrm{~mA}, \pm 3 \mathrm{~mA}$ ranges): $\mathrm{I}_{\text {high }} / 3=800 / 3=267 \mathrm{~A}$.
Active and reactive power:
Low scale, $0 \mathrm{~mA} / 4 \mathrm{~mA}$ ( $4-20 \mathrm{~mA}, 0-20 \mathrm{~mA}, 0-1 \mathrm{~mA}, 0-2 \mathrm{~mA}, 0-3 \mathrm{~mA}$ ranges): $\mathrm{P}_{\text {low }}=$ -69,120 kW (kvar).
Low scale, $0 \mathrm{~mA}( \pm 1 \mathrm{~mA}, \pm 2 \mathrm{~mA}, \pm 3 \mathrm{~mA}$ range $)$ : $\mathrm{P}_{\mathrm{low}}=0 \mathrm{~kW}(\mathrm{kvar})$.
High scale, $1 \mathrm{~mA} / 20 \mathrm{~mA}(4-20 \mathrm{~mA}, 0-20 \mathrm{~mA}, 0-1 \mathrm{~mA}, \pm 1 \mathrm{~mA}$ ranges $): \mathrm{P}_{\text {high }}=69,120 \mathrm{~kW}$ (kvar).
High scale, 1 mA (0-2 mA range): 0 kW (kvar).
High scale, 1 mA ( $\pm 2 \mathrm{~mA}$ range): $\mathrm{P}_{\text {high }} / 2=69,120 / 2=34560 \mathrm{~kW}$ (kvar).
High scale, 1 mA (0-3 mA range): $\mathrm{P}_{\text {low }} / 3=-69,120 / 3=-11520 \mathrm{~kW}$ (kvar).
High scale, 1 mA ( $\pm 3 \mathrm{~mA}$ range): $\mathrm{P}_{\text {high }} / 3=69,120 / 3=11520 \mathrm{~kW}$ (kvar).

## Example 2

The meter with regular $\pm 1 \mathrm{~mA}$ analog outputs ( $100 \%$ overload) is installed on the power line of Example 1. The analog outputs are programmed in the meter for the $\pm 1 \mathrm{~mA}$ output range.

What should the analog output currents be if the instrument shows the following measured (real) quantities?

```
Voltage = 24,800 V
Current = 460A
Active power P}\mp@subsup{\textrm{P}}{\mathrm{ TOTAL }}{}=17170\textrm{kW
Apparent power Stotal = 19736 kVA
```

The output currents would be as follows:
Voltage output: $I_{A O}=\frac{V_{\text {REAL }}-V_{\text {LOW }}}{V_{\mathrm{HIGH}^{-}} \mathrm{V}_{\text {LOW }}}=\frac{24800-0}{28800-0}=0.861 \mathrm{~mA}$

Active power output:

$$
I_{\text {AO }}=\frac{\left(P_{\text {REAL }}-P_{\text {LOW }}\right) \times 2}{\text { PHIGH } \text { PLow }}-1=\frac{((17170-(-69129) \times 2}{69120-(-69120}-1=0.248 \mathrm{~mA}
$$

Apparent power output: $\quad I_{A O}=\frac{S_{\text {REAL }}-\text { SLOW }}{\text { SHIGH }^{-S L O W}}=\frac{19736-0}{69120-0}=0.286 \mathrm{~mA}$

## Example 3

The meter with regular $\pm 1 \mathrm{~mA}$ analog outputs ( $100 \%$ overload) is installed on the power line of Example 1. The analog outputs are programmed in the meter for the $\pm 2 \mathrm{~mA}$ output range

What should the analog output currents be if the instrument shows the measured (real) quantities like in Example 2?

The output currents would be as follows:
Voltage output: $I_{\text {AO }}=\frac{\left(\mathrm{V}_{\text {REAL }}-\mathrm{V}_{\text {LOW }}\right) \times 2}{\mathrm{~V}_{\text {HIGH }}-\mathrm{V}_{\text {LOW }}}=\frac{(24800-0) \times 2}{28800-0}=1.722 \mathrm{~mA}$
Current output: $\mathrm{I}_{\text {AO }}=\frac{\left(\mathrm{I}_{\text {REAL }}-\mathrm{I}_{\text {LOW }}\right) \times 2}{\mathrm{I}_{\mathrm{HIGH}}-\mathrm{I}_{\text {LOW }}}=\frac{(460-0) \times 2}{800-0}=1.15 \mathrm{~mA}$

Active power output:

Apparent power output: $\quad I_{A O}=\frac{\left(S_{\text {REAL }}-\text { SLOW } \times 2\right.}{S_{\text {HIGH }}-\text { SLOW }}=\frac{(19736-0) \times 2}{69120-0}=0.571 \mathrm{~mA}$

## Example 4

The meter with regular $\pm 1 \mathrm{~mA}$ analog outputs ( $100 \%$ overload) is installed on the power line of Example 1. The analog outputs are programmed in the meter for the $\pm 2 \mathrm{~mA}$ output range.

Which real electrical quantities does the meter measure if the analog output currents are as follows?

$$
\begin{aligned}
& \text { Voltage analog output } \mathrm{I}_{\mathrm{AO} 1}=0.861 \mathrm{~mA} \\
& \text { Current analog output } \mathrm{I}_{\mathrm{AO} 2}=1.15 \mathrm{~mA} \\
& \text { Active power analog output } \mathrm{I}_{\mathrm{AO} 3}=0.497 \mathrm{~mA}
\end{aligned}
$$

Apparent power analog output $\mathrm{I}_{\mathrm{AO4} 4}=0.571 \mathrm{~mA}$

## The meter readings would be as follows:

Measured voltage: $\mathrm{V}_{\text {REAL }}=I_{\text {AO }} \times\left(\mathrm{V}_{\text {HIGH }}-\mathrm{V}_{\text {LOW }}\right) / 2+\mathrm{V}_{\text {LOw }}=0.861 \times(28800-0) / 2+0=12398 \mathrm{~V}$
Measured current: $I_{\text {REAL }}=I_{\text {AO }} \times\left(I_{\text {HIGH }}-I_{\text {LOw }}\right) / 2+I_{\text {LOW }}=1.15 \times(800-0) / 2+0=460 \mathrm{~A}$
Measured active power: $\mathrm{P}_{\text {REAL }}=\left(\mathrm{I}_{\text {AO }}+2\right) \times\left(\mathrm{P}_{\text {HIGH }}-\mathrm{P}_{\text {Low }}\right) / 4+\mathrm{P}_{\text {Low }}=(0.497+2) \times(69120-$ $(-69120)) / 4+(-69120)=17176 \mathrm{~kW}$

Measured apparent power: $\mathrm{S}_{\text {REAL }}=\mathrm{I}_{\mathrm{AO}} \times\left(\mathrm{S}_{\text {HIGH }}-\mathrm{S}_{\text {Low }}\right) / 2+\mathrm{S}_{\text {Low }}=0.571 \times(69120-0) / 2+0=$ 19734 kVA
